Outline

- ▶ Four Phases of Industrial Revolution
- ▶ 4th Industrial Revolution
- ▶ Building Blocks of Industry 4.0
- ▶ Digital Enterprises/Smart Factories
- ▶ Internet of Things/Cyber Physical Systems
- ▶ Technologies Reshaping the Production
- ▶ A Smart Factory Example: Bosch Rexroth Case
- ▶ Recap/Discussions/Questions

The Role of Wheat in the History of Mankind

- Wheat was domesticated by 8000 BC.
- Humans learned to turn wheat into flour and then into bread.

Milestones of Industrial Revolutions

The 4th Industrial Revolution Is Upon Us.

FROM INDUSTRY 1.0 TO INDUSTRY 4.0

FIRST INDUSTRIAL REVOLUTION

Introduction of mechanical production facilities with the help of water and steam power

1784

First Mechanical Loom

SECOND INDUSTRIAL REVOLUTION

Introduction of a division of labor and mass production with the help of electrical energy

1870

First Assembly Line

THIRD INDUSTRIAL REVOLUTION

Use of electronic and IT systems that further automate production

1969

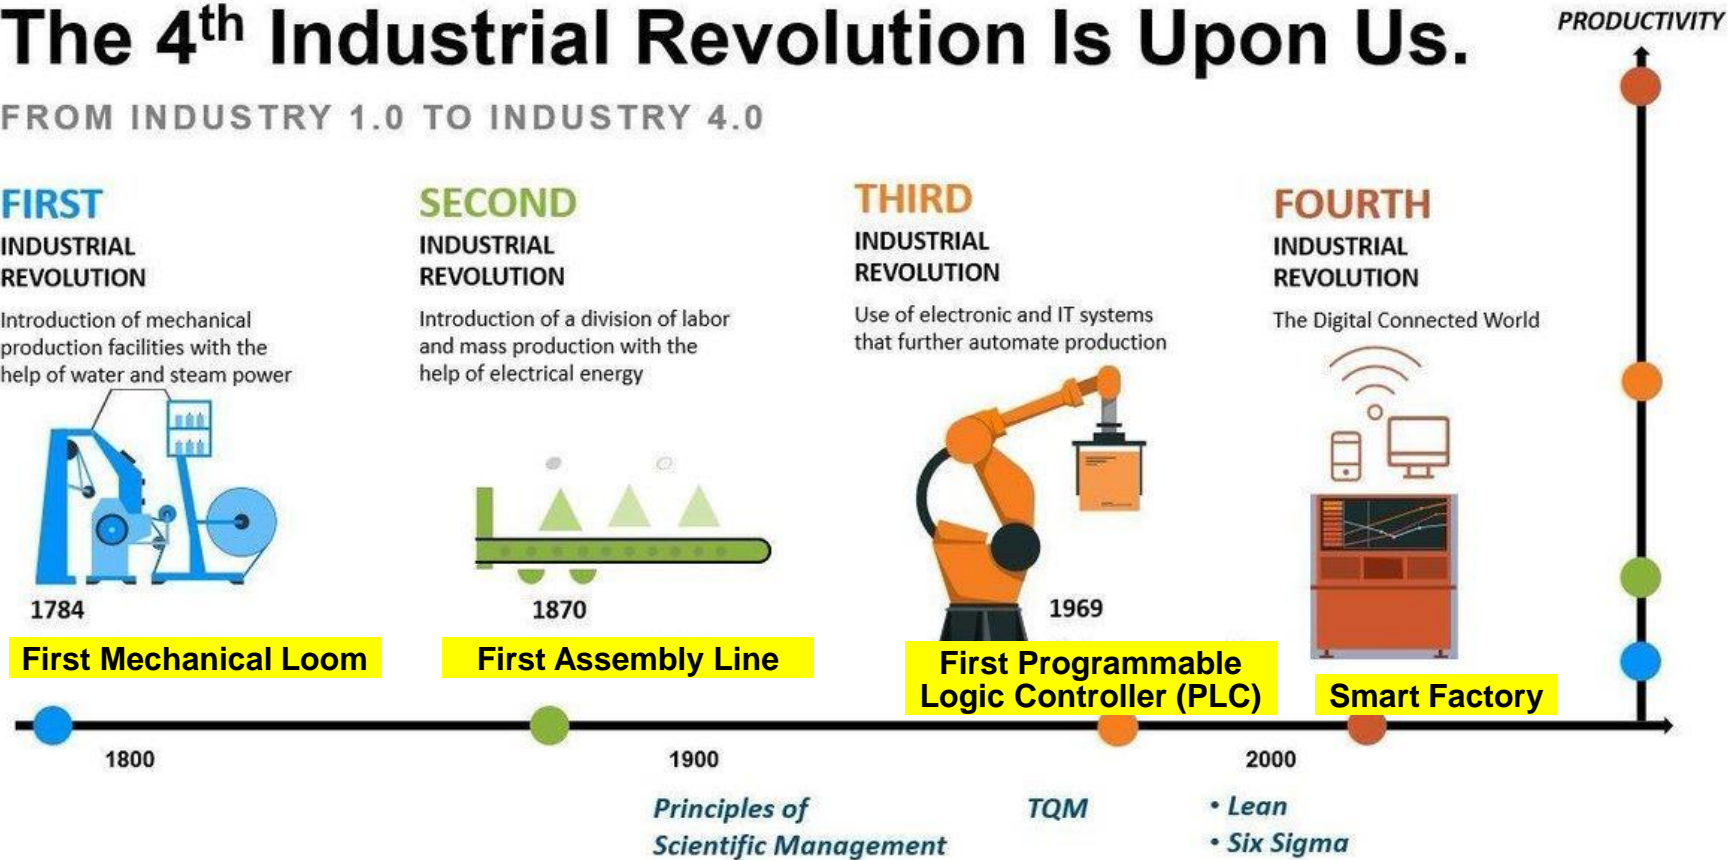

First Programmable Logic Controller (PLC)

FOURTH INDUSTRIAL REVOLUTION

The Digital Connected World

Smart Factory

Industry 4.0

- **The fourth industrial revolution**, also known as Industry 4.0, is affecting almost every industry worldwide.
- It is rapidly transforming how businesses operate.
- Industry 4.0 uses transformative technologies to connect the physical world with the digital world.

Transformative Technology

Disruptive Technology

Disruptive Technologies: Advances that will transform life, business, and the global economy (McKinsey)

- ✓ A disruptive technology supersedes an older process, product, or habit.
- ✓ It usually has superior attributes that are immediately obvious, at least to early adopters.
- ✓ The automobile, electricity service, and television all were disruptive technologies in their own times.

*** Another term that can be used is transformative technology. Because a disruption, once accepted, can become transformative.

Disruptive Technologies

The parade of new technologies and scientific breakthroughs is relentless and is unfolding on many fronts.

Yet some technologies do in fact have the potential to disrupt the status quo, alter the way people live and work, rearrange value pools, and lead to entirely new products and services.

SOURCE: McKinsey Global Institute analysis

Characteristics of Disruptive Technologies

1. Disruptive technologies typically demonstrate a rapid rate of change in capabilities in terms of price/performance relative to substitutes and alternative approaches.
2. To be economically disruptive, a technology must have broad reach. (Touching companies and industries and affecting (or giving rise to) a wide range of machines, products, or services)
3. An economically disruptive technology must have the potential to create massive economic impact.
4. Technologies that matter have the potential to dramatically change the status quo.

Today's Disruptive Technologies

Mobile Internet

Automation of knowledge work

The Internet of Things

Cloud technology

Advanced robotics

Autonomous and near-autonomous vehicles

Next-generation genomics

Energy storage

Advanced materials

3D printing

Advanced oil and gas exploration and recovery

Renewable energy

Industry 4.0 and Its Building Blocks

The term Industry 4.0 refers to the combination of **several major innovations in digital technology**.

These technologies include:

- Advanced Robotics
- Artificial Intelligence
- Sophisticated Sensors
- Big Data Analytics
- Cloud Computing
- The Internet of Things
- Digital Fabrication (incl. 3D Printing)
- Autonomous Vehicles
- Virtual Reality and Augmented Reality

Smart Factory Concept

- ▶ Smart Factories are fully connected flexible manufacturing systems that autonomously run the entire production system with less or no human interaction.
- ▶ Smart factories are:
 1. **Visible** (Traceable through IoT, sensors)
 2. **Connected** (via Cyber-Physical Systems)
 3. **Autonomous** (run and make decentralized decision independently)

Smart Factories/Digital Enterprises

- ▶ The smart factory represents a leap forward from more traditional automation to a fully connected and flexible system (Deloitte Insights)

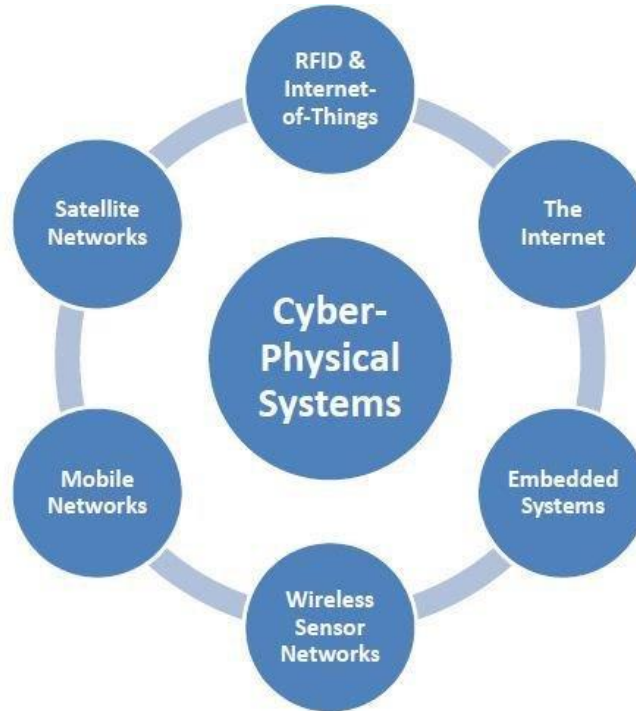

Smart Factory Concept

The Internet of Things (IoT): A concept that refers to connections between physical objects like sensors, machines and the Internet.

Smart Factory Concept

Cyber-Physical Systems (CPS): (aka. cyber manufacturing) Refers to an Industry 4.0-enabled manufacturing environment that offers real-time data collection, analysis, and transparency across every aspect of a manufacturing operation.

Relationship of IoT and CPS

- Internet of Things (IoT) is the key foundation of Cyber Physical Systems (CPS).
- The IoT **allows objects** to be remotely **sensed** and **controlled across existing network infrastructure**.

In a Nut Shell...

** Internet of Things is about connecting "Things" (Objects and Machines) to the internet and eventually to each other; while Cyber Physical Systems (CPS) are integration of computation, networking and physical processes.

An Interesting Fact

According to Statista, a major online market research portal, the number of IoT connected devices worldwide will be just over 30 billion in 2020, **doubling in just five years.**

Another Fact: Techs did not exist in 2006

- ▶ iPhone
- ▶ iPad
- ▶ Kindle
- ▶ 4G
- ▶ Uber
- ▶ Airbnb
- ▶ Android
- ▶ Oculus
- ▶ Instagram
- ▶ Snapchat
- ▶ WhatsApp

More Facts: Time to Reach 50 million users

How is IoT related to Smart Manufacturing?

Smart manufacturing is enabled by IoT connected devices, big data, data analytics, robotics, machine learning, sensor technologies, and artificial intelligence.

Each of these technologies are used together to

1. Optimize manufacturing processes
2. Assist manufacturers
3. Keep workers safe

More Potential Effects of Smart Manufacturing

1. Greater operating efficiency

- * implement real-time solutions

2. Minimal machine downtime

- * real-time IoT sensor data can be turned into predictive maintenance insights.

3. Increased worker safety

- * people's movements and activities can be tracked and analyzed, injury risk mitigation

4. Optimized inventorying

- * location of parts and products before, during, and after manufacturing

5. Supply chain management

- * IoT device geolocation to track shipments, parts, and products

Size of the IoT market worldwide from 2017 to 2025 (in billion U.S. dollars)

Technologies Reshaping Production

Nine Technologies Are Reshaping Production

Advanced robots

- Autonomous, cooperating industrial robots, with integrated sensors and standardized interfaces

Additive manufacturing

- 3D printers, used predominantly to make spare parts and prototypes
- Decentralized 3D printing facilities, which reduce transport distances and inventory

Augmented reality

- Digital enhancement, which facilitates maintenance, logistics, and SOPs
- Display devices, such as glasses

Simulation

- Network simulation and optimization, which use real-time data from intelligent systems

Horizontal and vertical system integration

- Data integration within and across companies using a standard data transfer protocol
- A fully integrated value chain (from supplier to customer) and organization structure (from management to shop floor)

The Industrial Internet of Things

- A network of machines and products
- Multidirectional communication among networked objects

Cloud computing

- The management of huge volumes of data in open systems
- Real-time communication for production systems

Cybersecurity

- The management of heightened security risks due to a high level of networking among intelligent machines, products, and systems

Big data and analytics

- The comprehensive evaluation of available data (from CRM, ERP, and SCM systems, for example, as well as from an MES and machines)
- Support for optimized real-time decision making

Source: BCG analysis.

Note: SOP = standard operating procedure. CRM = customer relationship management. ERP = enterprise resource planning. SCM = supply chain management. MES = manufacturing execution system.
